### RETROVIRAL PROTEASE INHIBITORS

This application is a continuation-in-part of U. S. Patent Application Serial No. 07/615,210, filed November 19, 1990.

### BACKGROUND OF THE INVENTION

#### 1. Field of the Invention

The present invention relates to retroviral protease inhibitors and, more particularly, relates to novel compounds and a composition and method for inhibiting retroviral proteases. This invention, in particular, relates to urea-containing hydroxyethylamine protease inhibitor compounds, a composition and method for inhibiting retroviral proteases such as human immunodeficiency virus (HIV) protease and for treating a retroviral infection, e.g., an HIV infection. The subject invention also relates to processes for making such compounds as well as to intermediates useful in such processes.

#### 2. Related Art

During the replication cycle of retroviruses, gag and gag-pol gene products are translated as proteins. These proteins are subsequently processed by a virally encoded protease (or proteinase) to yield viral enzymes and structural proteins of the virus core. Most commonly, the gag precursor proteins are processed into the core proteins and the pol precursor proteins are processed into the viral enzymes, e.g., reverse transcriptase and retroviral protease. It has been shown that correct processing of the precursor proteins by the retroviral protease is necessary for assembly of infectious virions. For example, it has been shown that frameshift mutations in the protease region of the pol gene of HIV prevents processing of the gag precursor protein. Thus, attempts have been made to inhibit viral replication by inhibiting the action of retroviral proteases.

-2-

Retroviral protease inhibition typically involves a transition-state mimetic whereby the retroviral protease is exposed to a mimetic compound which binds (typically in a reversible manner) to the enzyme in competition with the gag and gag-pol proteins to thereby inhibit replication of structural proteins and, more importantly, the retroviral protease itself. In this manner, retroviral proteases can be effectively inhibited.

Several classes of mimetic compounds have been proposed, particularly for inhibition of proteases, such as for inhibition of HIV protease. Such mimetics include hydroxyethylamine isosteres and reduced amide isosteres. See, for example, EP O 346 847; EP O 342,541; Roberts et al, "Rational Design of Peptide-Based Proteinase Inhibitors, "Science, 248, 358 (1990); and Erickson et al, "Design Activity, and 2.8Å Crystal Structure of a C<sub>2</sub> Symmetric Inhibitor Complexed to HIV-1 Protease," Science, 249, 527 (1990).

Several classes of mimetic compounds are known to be useful as inhibitors of the proteolytic enzyme renin. See, for example, U.S. No. 4,599,198; U.K. 2,184,730; G.B. 2,209,752; EP O 264 795; G.B. 2,200,115 and U.S. SIR H725. Of these, G.B. 2,200,115, GB 2,209,752, EP O 264,795, U.S. SIR H725 and U.S. 4,599,198 disclose urea-containing hydroxyethylamine renin inhibitors. However, it is known that, although renin and HIV proteases are both classified as aspartyl proteases, compounds which are effective renin inhibitors generally cannot be predicted to be effective HIV protease inhibitors.

#### BRIEF DESCRIPTION OF THE INVENTION

The present invention is directed to virus inhibiting compounds and compositions. More particularly, the present invention is directed to retroviral protease inhibiting compounds and compositions, to a method of inhibiting retroviral proteases, to processes for preparing the compounds and

-3-

to intermediates useful in such processes. The subject compounds are characterized as urea-containing hydroxyethylamine inhibitor compounds.

However, such procedures are generally applicable, as illustrated in Example 45, to those compounds of opposite configuration, e.g., where the stereochemistry about the hydroxyl group is (S).

#### Preparation of Compounds of Formula I

The compounds of the present invention represented by Formula I above can be prepared utilizing the following general procedure. An N-protected chloroketone derivative of an amino acid having the formula:

wherein P represents an amino protecting group, and R<sup>2</sup> is as defined above, is reduced to the corresponding alcohol utilizing an appropriate reducing agent.

Suitable amino protecting groups are well known in the art and include carbobenzoxy, butyryl, t-butoxycarbonyl, acetyl, benzoyl and the like. A preferred amino protecting group is carbobenzoxy. A preferred N-protected chloroketone is N-benzyloxycarbonyl-L-phenylalanine chloromethyl ketone. A preferred reducing agent is sodium borohydride. The reduction reaction is conducted at a temperature of from -10°C to about 25°C, preferably at about 0°C, in a suitable solvent system such as, for example, tetrahydrofuran, and the like.

The N-protected chloroketones are commercially available from Bachem, Inc., Torrance, California. Alternatively,

the chloroketones can be prepared by the procedure set forth in S. J. Fittkau, J. Prakt. Chem., 315, 1037 (1973), and subsequently N-protected utilizing procedures which are well known in the art.

5 The resulting alcohol is then reacted, preferably at room temperature, with a suitable base in a suitable solvent system to produce an N-protected amino epoxide of the formula:

20 wherein P and R<sup>2</sup> are as defined above. Suitable solvent systems for preparing the amino epoxide include ethanol, methanol, isopropanol, tetrahydrofuran, dioxane, and the like including mixtures thereof. Suitable bases for  
25 producing the epoxide from the reduced chloroketone include potassium hydroxide, sodium hydroxide, potassium t-butoxide, DBU and the like. A preferred base is potassium hydroxide.

30 The amino epoxide is then reacted, in a suitable solvent system, with an excess of a desired amine of the formula:

wherein R<sup>3</sup> is hydrogen or is as defined above. The  
35 reaction can be conducted over a wide range of temperatures, e.g., from about 10°C to about 100°C, but is preferably, but not necessarily, conducted at a temperature at which the solvent begins to reflux. Suitable solvent systems include those wherein the solvent is an alcohol, such as methanol, ethanol,  
40 isopropanol, and the like, ethers such as tetrahydrofuran, dioxane and the like, and toluene, N,N-dimethylformamide, dimethyl sulfoxide, and mixtures

Exemplary amines corresponding to the formula  $R^3NH_2$  include benzyl amine, isobutylamine, n-butyl amine, isopentyl amine, isoamylamine, cyclohexanemethyl amine, naphthylene methyl amine and the like. The resulting product is a 3-(N-protected amino)-3-( $R^2$ )-1-( $NHR^3$ )-propan-2-ol derivative (hereinafter referred to as an amino alcohol) is a novel intermediate and can be represented by the formula:

wherein P,  $R^2$  and  $R^3$  are as described above.

Where B represents  $R^5$ , the salt of the resulting amino alcohol can be reacted with an isocyanate of the formula  $R^4NCO$  where  $R^5$  is hydrogen, or a compound of the formula

where  $R^5$  is other than hydrogen. In this formula  $R^4$  and  $R^5$  are as described above and L represents a leaving group such as a halide, e.g., chloride, an imidazole radical, the radical  $p\text{-NO}_2\text{-(C}_6\text{H}_4\text{)-O}$ , and the like. A preferred group of this formula is a carbamoyl chloride. The corresponding sulfur analogs can also be utilized where Y is S. These reactions are conducted in suitable solvent systems such as methylene chloride and tetrahydrofuran.

A salt of the resulting amino alcohol described above is then reacted, in a suitable solvent system, with carbonyldiimidazole and an amine salt to

produce a urea derivative of the amino alcohol. This reaction can be represented as follows:

wherein  $\text{R}^4$  is as described above and L represents a leaving group such as a halide, e.g., chloride, imidazole radical, the radical  $\text{p-NO}_2\text{-(C}_6\text{H}_4\text{)-O-}$ , and the like is prepared by reacting a carbonyldiimidazole with an amine salt, e.g., the hydrochloride salt of a compound represented by the formula:

in a suitable solvent such as, for example, chloroform. The resulting product is then reacted with the salt, such as, for example, the hydrochloride salt, of the amino alcohol described above. The corresponding sulfur analogs can be utilized where Y of Formula II is S.

Alternatively, one can react the amino alcohol with an isocyanate of the formula:

either in the presence or absence of a suitable base, such as triethylamine, diisopropylethylamine, and the like in a suitable solvent such as toluene, methylene chloride, chloroform or tetrahydrofuran. The isocyanate can be readily prepared and isolated, if desired, by standard methods such as the reaction of an amine of the formula:

with phosgene or a phosgene equivalent, such as triphosgene, in the presence or absence of a suitable base, such as triethylamine, diisopropylamine and the like in a suitable solvent such as toluene, methylene chloride, chloroform or tetrahydrofuran. Alternatively, one can generate the isocyanate in situ by the Curtius rearrangement of a carboxylic acid of the formula:

by an appropriate method. One such method is by the reaction of the carboxylic acid with diphenylphosphoryl azide in the presence of a suitable base, such as triethylamine or diisopropylethylamine, in a suitable solvent such as toluene, methylene chloride, chloroform and tetrahydrofuran and the like.

The carboxylic acids are either commercially available or can be prepared in a number of ways, which are known to those skilled in the art. For example, one

-16-

can form the dianion of a carboxylic acid (or the monoanion of the corresponding ester) of the formula:

by deprotonation with a strong base, such as lithium diisopropyl amide or lithium hexamethyldisilazide, in a suitable solvent such as tetrahydrofuran and react the anion or dianion with an electrophilic reagent of the formula:

where X is an appropriate leaving group such as chloride, bromide, iodide, methanesulfonyl, p-toluenesulfonyl or trifluoromethanesulfonyl and the like.

Alternatively, one can alkylate a diester of malonic acid of the formula:

where P' is a suitable acid protecting groups such as methyl, ethyl, isopropyl, benzyl, tertiary-butyl, trimethylsilyl, t-butyldimethylsilyl, and the like, with appropriate electrophiles:

-17-

where  $R^7$ ,  $R^{7'}$  and  $X$  are as defined above, in the presence of a suitable base such as sodium hydride, potassium hydride, sodium alkoxide or potassium alkoxide.

Suitable alkoxides being methoxide, ethoxide,

5 isopropoxide and tertiary-butoxide and the like. The

reaction is carried out in a suitable solvent such as tetrahydrofuran,  $N,N$ -dimethylformamide or an alcohol

solvent, such as methanol, ethanol, isopropanol or

tertiary-butanol. The reaction with  $R^7$  and  $R^{7'}$  can be

10 done sequentially if  $R^7$  and  $R^{7'}$  are different, or

simultaneously if  $R^7$  and  $R^{7'}$  are identical or form a

cyclic ring during the alkylation step. The resulting

product is a mono- or di-substituted malonate diester of the formula:

25

In order to generate the carboxylic acid required for the Curtius rearrangement, the acid protecting group  $P'$  is selectively removed. Suitable

30 methods for removal are (1) hydrolysis with lithium hydroxide, sodium hydroxide, potassium hydroxide and the like, (2) acidolysis with an acid such as hydrochloric acid, hydrobromic acid, trifluoroacetic acid and the like, and (3) hydrogenolysis with hydrogen in the

35 presence of a suitable catalyst such as palladium-on-carbon. The resulting carboxylic acid has the formula:

45

-18-

In the case where  $\text{R}^8$  is an amino group  $\text{NR}^{16}\text{R}^{17}$ , the amino group can be introduced either by displacement of an appropriate leaving group or reductive amination with an appropriate aldehyde. The displacement of the leaving group from an ester of the formula:

where  $\text{P}'$  and  $\text{X}$  are as defined above, can be readily accomplished by one skilled in the art. The protecting group  $\text{P}'$  is then removed by the methods discussed above to provide the required carboxylic acid of the formula:

The reductive amination procedure is readily accomplished by the reaction of an aldehyde of the formula:

with the amine  $\text{HNR}^{16}\text{R}^{17}$  in the presence of sodium cyanoborohydride or hydrogen and a suitable catalyst, such as palladium-on-carbon, and the acid protecting group  $\text{P}'$  is removed by the methods discussed above. The required aldehydes can be prepared by a number of methods well-known to those in the art. Such methods include reduction of an ester, oxidation of an alcohol or ozonolysis of an olefin.

In the case where  $\text{R}^8$  is a keto-group and  $t$  is 0, one can mono- or dialkylate an ester of acetoacetic acid of the formula:

as described above for the malonate diesters to provide a compound of the formula:

The acid protecting group can be removed to provide the desired carboxylic acid for the Curtius rearrangement, or the ketone can be converted to a ketal, such as the dimethyl ketal, diethyl ketal or ethylene glycol ketal,

-20-

by reaction with the appropriate alcohol in the presence of a suitable acid, such as p-toluenesulfonic acid or the like, and a dehydrating agent such as trimethyl- or triethylorthoformate to provide, for example, a compound of the following formula:

The protecting group P' can then be removed to provide a compound of the formula:

which is suitable for the Curtius rearrangement. If desired, the ketal group can be converted at any time during the subsequent synthesis to the corresponding ketone by hydrolysis in the presence of an acid such as aqueous hydrochloric acid.

The urea derivative of the amino alcohol, and the corresponding sulfur analog can be represented by the formula:

-21-

5

- 10 Following preparation of the urea derivative, or corresponding analogs wherein Y is S, the amino protecting group P is removed under conditions which will not affect the remaining portion of the molecule. These methods are well known in the art and include acid
- 15 hydrolysis, hydrogenolysis and the like. A preferred method involves removal of the protecting group, e.g., removal of a carbobenzoxy group, by hydrogenolysis utilizing palladium on carbon in a suitable solvent system such as an alcohol, acetic acid, and the like or
- 20 mixtures thereof. Where the protecting group is a t-butoxycarbonyl group, it can be removed utilizing an inorganic or organic acid, e.g., HCl or trifluoroacetic acid, in a suitable solvent system, e.g., dioxane or methylene chloride. The resulting product is the amine salt derivative. Following neutralization of the salt,
- 25 the amine is then reacted with a substituted sulfonyl derivative of an amino acid or corresponding analog or derivative thereof represented by the formula (RSO<sub>2</sub>N[CR<sup>1</sup>R<sup>1'</sup>]<sub>t</sub>CH(R<sup>1</sup>)COOH) wherein t, R<sup>1</sup>, R<sup>1'</sup> and R<sup>1''</sup> are as
- 30 defined above, to produce the antiviral compounds of the present invention having the formula:

35

40

wherein t, B, R, R<sup>1</sup>, R<sup>1'</sup>, R<sup>1''</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, and Y are as defined above. The sulfonyl derivative of the amino

acid or corresponding analog or derivative thereof is reacted with a substituted sulfonyl chloride ( $\text{RSO}_2\text{Cl}$ ) at a suitable pH value, e.g. pH9, to produce the corresponding sulfonamide. Alternatively, the amine salt can be reacted with a protected amino acid and the resulting compound deprotected and then reacted with a sulfonyl chloride. Where the amine is reacted with a substituted sulfonyl derivative of an amino acid, e.g., when  $t=1$  and  $\text{R}'$  and  $\text{R}''$  are both H, so that the amino acid is a  $\beta$ -amino acid, such  $\beta$ -amino acids can be prepared according to the procedure set forth in a copending application, U. S. Serial No. 07/345,808. Where  $t$  is 1, one of  $\text{R}'$  and  $\text{R}''$  is H and  $\text{R}'$  is hydrogen so that the amino acid is a homo- $\beta$ -amino acid, such homo- $\beta$ -amino acids can be prepared by the same procedure. Where  $t$  is 0 and  $\text{R}'$  is alkyl, cycloalkyl,  $-\text{CH}_2\text{SO}_2\text{NH}_2$  or an amino acid side chain, such materials are well known and many are commercially available from Sigma-Aldrich.

Alternatively, the protected amino alcohol from the epoxide opening can be further protected at the newly introduced amino group with a protecting group  $\text{P}'$  which is not removed when the first protecting P is removed. One skilled in the art can choose appropriate combinations of P and  $\text{P}'$ . One suitable choice is when P is Cbz and  $\text{P}'$  is Boc. The resulting compound represented by the formula:

can be carried through the remainder of the synthesis to provide a compound of the formula:

-23-

and the new protecting group P' is selectively removed, and following deprotection, the resulting amine reacted to form the urea derivative as described above. This selective deprotection and conversion to the urea can be accomplished at either the end of the synthesis or at any appropriate intermediate step if desired. This alternate procedure is also suitable for producing compounds of formula III.

It is contemplated that for preparing compounds of the Formulas having R<sup>6</sup>, the compounds can be prepared following the procedure set forth above and, prior to coupling the urea derivative or analog thereof to the amino acid PNH(CH<sub>2</sub>)<sub>2</sub>CH(R<sup>1</sup>)COOH, carried through a procedure referred to in the art as reductive amination. Thus, a sodium cyanoborohydride and an appropriate aldehyde R<sup>6</sup>C(O)H or ketone R<sup>6</sup>C(O)R<sup>6</sup> can be reacted with the urea derivative compound or appropriate analog at room temperature in order to reductively aminate any of the compounds of Formulas I-VI. It is also contemplated that where R<sup>3</sup> of the amino alcohol intermediate is hydrogen, the inhibitor compounds can be prepared through reductive amination of the final product of the reaction between the amino alcohol and the amine or at any other stage of the synthesis for preparing the inhibitor compounds.

Contemplated equivalents of the general formulas set forth above for the antiviral compounds and derivatives as well as the intermediates are compounds otherwise corresponding thereto and having the same

general properties wherein one or more of the various R groups are simple variations of the substituents as defined therein, e.g., wherein R is a higher alkyl group than that indicated. In addition, where a substituent  
5 is designated as, or can be, a hydrogen, the exact chemical nature of a substituent which is other than hydrogen at that position, e.g., a hydrocarbyl radical or a halogen, hydroxy, amino and the like functional group, is not critical so long as it does not adversely  
10 affect the overall activity and/or synthesis procedure.

The chemical reactions described above are generally disclosed in terms of their broadest application to the preparation of the compounds of this invention. Occasionally, the reactions may not be  
15 applicable as described to each compound included within the disclosed scope. The compounds for which this occurs will be readily recognized by those skilled in the art. In all such cases, either the reactions can be successfully performed by conventional modifications  
20 known to those skilled in the art, e.g., by appropriate protection of interfering groups, by changing to alternative conventional reagents, by routine modification of reaction conditions, and the like, or other reactions disclosed herein or otherwise  
25 conventional, will be applicable to the preparation of the corresponding compounds of this invention. In all preparative methods, all starting materials are known or readily preparable from known starting materials.

Without further elaboration, it is believed  
30 that one skilled in the art can, using the preceding description, utilize the present invention to its fullest extent. The following preferred specific embodiments are, therefore, to be construed as merely illustrative, and not limitative of the remainder of the  
35 disclosure in any way whatsoever.

All reagents were used as received without purification. All proton and carbon NMR spectra were

obtained on either a Varian VXR-300 or VXR-400 nuclear magnetic resonance spectrometer.

Methyl aminoisobutyrate hydrochloride.

A 500 mL round bottomed flask equipped with nitrogen inlet, thermometer adapter, solids addition funnel, and magnetic stirrer was placed in an ice salt bath and charged with 100 mL of methanol. To this solution was added thionyl chloride (18.0 mL, 0.25 mol) via syringe at such a rate that the internal temperature was maintained at less than 0 °C. This solution was then treated with aminoisobutyric acid (19.6g, 0.19 mol) portion wise from the addition funnel at such a rate that the temperature did not rise above 5 °C. The ice bath was removed and replaced with an oil bath and the solution warmed to 50 °C for 1h and then concentrated in vacuo. The salt was thoroughly dried under vacuum to give the desired product as a white solid 28g, 96%, mp 185 °C. <sup>1</sup>H nmr (CDCl<sub>3</sub>) 300 MHz 8.87(brs, 3H), 3.74(s, 3H), 1.65(s, 6H).

A 100 mL round bottomed flask equipped with a reflux condenser, nitrogen inlet, and magnetic stir bar was charged with methyl aminoisobutyrate hydrochloride (298 mg, 1.95 mmol) and 30 mL of chloroform. The slurry was warmed to reflux whereupon the salt dissolved and then the solution was treated with carbonyldiimidazole (317 mg, 1.95 mmol) and maintained at this temperature for 40 m. In a separate 50 mL round bottomed flask was placed the hydrochloride of (2R,3S)-3-amino-1-(3-methylbutyl)-1-[(1,1-dimethylethyl)amino] carbonyl)-4-phenyl-2-butan-1-ol (910 mg, 1.68 mmol), 20 mL of chloroform and triethylamine (648 mg, 6.40 mmol). This mixture was stirred at room temperature for 30 m and then added to the 100 mL round bottomed flask. The entire mixture was heated to 50 °C for 16 h and then poured into a separatory funnel. The mixture was diluted with 5% aq. citric acid and the phases separated. The organic phase was washed with an additional portion of citric acid, sat. aq. NaHCO<sub>3</sub>, brine, dried over anhyd. MgSO<sub>4</sub>, filtered and concentrated in vacuo to give a white solid, 820 mg, 75%, that was further purified by flash chromatography over SiO<sub>2</sub> eluting with methanol/CH<sub>2</sub>Cl<sub>2</sub>. The pure product was isolated by concentration of the appropriate fraction, 410 mg, 38% yield along with 150 mg of 95% pure product.

Example 2BGeneral Procedure for Curtius Rearrangement and Reaction with Amino Alcohol Derivative.

To a solution of 1 mmol of carboxylic acid in 12 mL of  
5 toluene and 3 mmol of triethylamine at 90°C under a  
nitrogen atmosphere, was added 1 mmol of  
diphenylphosphoryl azide. After 1 hour, a solution of 1  
mmol of amino alcohol derivative in 3.5 mL of either  
N,N-dimethylformamide or toluene was added. After 1  
10 hour, the solvent was removed under reduced pressure,  
ethyl acetate and water added and the layers separated.  
The organic layer was washed with 5% citric acid, sat d  
sodium bicarbonate, brine, dried, filtered and  
concentrated to afford the crude product. This was then  
15 recrystallized or chromatographed on silica gel to  
afford the purified final compound.

Preparation of mono-tertiary-butyl 2,2-dimethylmalonate.

To a solution of mono-methyl mono-t-butyl malonate  
20 (20.5g, 117.7 mmol) in THF (275 ml) was added NaH  
(2.95g, 117.7 mmol) in portions at 0°C over 15 min then  
stirred at r.t. for 30 min. The mixture was then cooled  
to 0°C and to this was added MeI (7.5 ml, 118 mmol)  
slowly and stirred at r.t. for 1 h. After it was cooled  
25 to 0°C, to this cold solution was added NaH (2.95g, 118  
mmol) then MeI (7.5 ml, 118 mmol) by following the  
procedure described above. A usual workup (10 ml sat.  
NH<sub>4</sub>Cl, 100 ml Et<sub>2</sub>O-pet ether, 5% HCl, 5% NaHCO<sub>3</sub>, finally  
sat. NaCl) gave 16.2g (68%) of desired product as a pale  
30 yellow oil. The oil (10.1g, 50.0 mmol) was dissolved in  
MeOH (150 ml) and to this was added 1.25N NaOH (20 ml of  
2.5N NaOH with 20 ml of H<sub>2</sub>O, 50.0 mmol) over a period of  
2 h and stirred at 0°C for 3 h and r.t. for 16 h.  
Removal of solvents in vacuo (<40°C) gave an oil. The  
35 oil was dissolved in water (125 ml) and extracted with  
Et<sub>2</sub>O (25 ml). The aqueous layer was collected and  
acidified with 6N HCl (a white precipitate was formed  
immediately) to pH - 1 and extracted with Et<sub>2</sub>O (75 ml x

Example 5

This example illustrates an alternate procedure for preparing compounds of Formula II.

A. IntermediatesPreparation of 2,2-Dimethyl-3-phenylpropionic Acid

To a mixture of 1.23g (41.0 mmol) of 80% sodium hydride and 50 mL of anhydrous tetrahydrofuran under a nitrogen atmosphere, was added 3.88g (38.3 mmol) of diisopropylamine and then 3.3g (37.5 mmol) of isobutyric acid. After heating at reflux for 15 minutes and cooling to 0°C, 15 mL (37.5 mmol) of 2.5M n-butyllithium in hexane was added. The mixture was warmed to 35°C for 30 min, cooled to 0°C and 6.40g (37.5 mmol) of benzyl bromide added. The mixture was stirred for 30 minutes at 0°C, then warmed to 35°C for one hour and recooled to 0°C. Water was added and the aqueous layer extracted with diethyl ether, acidified with 6N aqueous HCl and

-49-

extracted with diethyl ether. The organic layer was dried and concentrated to provide 4.0g of crude product. Chromatography on silica gel using 10% methanol/methylene chloride afforded 1.0g of pure 2,2-dimethyl-3-phenylpropionic acid, m/e 185 (M + Li).

Preparation of 2,2-Dimethyl-3-(4-pyridyl)propionic Acid

Under a nitrogen atmosphere, 1.23g (41 mmol) of 80% sodium hydride was added to 50 mL of anhydrous tetrahydrofuran, followed by 3.88g (38.3 mmol) of diisopropylamine. To the resulting mixture was added 3.3g (37.5 mmol) of isobutyric acid and the resulting mixture heated to reflux for 15 minutes. Upon cooling to 0°C, 15 mL (37.5 mmol) of 2.5M n-butyllithium in hexane was added and the mixture then warmed to 35°C for 30 minutes. After cooling to 0°C, 4.8g (37.5 mmol) of 4-chloromethylpyridine (freshly prepared by neutralization of the hydrochloride salt with aqueous sodium bicarbonate, extraction with hexane, dried and concentrated) was added. After 30 minutes at 0°C, the mixture was warmed to 30°C for one hour, cooled to 0°C and 50 mL of water carefully added. The aqueous layer was separated and washed twice with diethyl ether, acidified with 6N aqueous hydrochloric acid, rewashed twice with diethyl ether and then neutralized with aqueous sodium bicarbonate. To a solution of 75.0g (0.226 mol) of N-benzyloxycarbonyl-L-phenylalanine chloromethyl ketone in a mixture of 807 mL of methanol and 807 mL of tetrahydrofuran at -2°C, was added 13.17g (0.348 mol, 1.54 equiv.) of solid sodium borohydride over one hundred minutes. The solvents were removed under reduced pressure at 40°C and the residue dissolved in ethyl acetate (approx. 1L). The solution was washed sequentially with 1M potassium hydrogen sulfate, saturated sodium bicarbonate and then saturated sodium chloride solutions. After drying over anhydrous magnesium sulfate and filtering, the solution was removed under reduced pressure. To the resulting oil was added hexane (approx. 1L) and the mixture warmed to 60°C with swirling. After cooling to room temperature, the solids were collected and washed with 2L of hexane. The resulting solid was recrystallized from hot ethyl acetate and hexane to afford 32.3g (43% yield) of N-benzyloxycarbonyl-3(S)-amino-1-chloro-4-phenyl-2(S)-butanol, mp 150-151°C and  $M+Li^+ = 340$ .

#### Part B:

After stirring for fifteen minutes, the solvent was removed under reduced pressure and the solids dissolved in methylene chloride. After washing with water, drying over magnesium sulfate, filtering and stripping, one obtains 27.9g of a white solid. Recrystallization from

h t ethyl acetate and hexane afforded 22.3g (77% yield) of N-benzyloxycarbonyl-3(S)-amino-1,2(S)-epoxy-4-phenylbutane, mp 102-103°C and  $MH^+$  298.

EXAMPLE 9

Additi nal exemplary compounds of the present invention ar listed in Table 1. These compounds were prepared according to the following general procedures.

5 General Procedure for the Synthesis of 1,3-Diamino 4-phenyl Butan-2-ol Derivatives.

A mixture of the amine  $R^3NH_2$  (20 equiv.) in dry isopropyl alcohol (20mL/mmol of epoxide to be converted) was heated to reflux and then treated with an  
10 N-Cbz amino epoxide of the formula:

20 from a solids addition funnel over a 10-15 minute period. After the addition is complete the solution was maintained at reflux for an additional 15 minutes and the progress of the reaction monitored by TLC. In nearly all cases the reaction was found to be complete  
25 after this time period. The reaction mixture was then concentrated in vacuo to give an oil that was treated with n-hexane with rapid stirring whereupon the ring opened material precipitated from solution.

Precipitation was generally complete within 1 hr and the  
30 product was then isolated by filtration on a Büchner funnel and then air dried. The product was further dried in vacuo. This method affords amino alcohols of sufficient purity for most purposes.

35 General procedure for the Reaction of Amino Alcohols with Isocyanates: Preparation of Ureas

A solution from the amino alcohol in tetrahydrofuran (THF) was treated at room temperature with the appropriate isocyanate of formula  $R^4NCO$  via syringe under nitr gen. After the reaction has stirred  
40 for -5m the progr ss of the reaction was monitored by TLC. In nearly all cases the reaction was complete.

The solvent was removed in vacuo and the product obtained was of sufficient purity for most purposes.

The product may be further purified by dissolution in ethyl acetate and washing with 5% aqueous citric acid, water, and brine. The solvent is dried over anhydrous magnesium sulfate, filtered and concentrated in vacuo to give the pure urea.

General Procedure for the Removal of the Protecting Groups by Hydrogenolysis with Palladium on Carbon

10 A. Alcohol Solvent

The Cbz-protected peptide derivative was dissolved in methanol (ca. 20mL/mmol) and 10% palladium on carbon catalyst is added under a nitrogen atmosphere. The reaction vessel is sealed and flushed 5 times with nitrogen and then 5 times with hydrogen. The pressure is maintained at 50 psig for 1-16 hours and then the hydrogen replaced with nitrogen and the solution filtered through a pad of celite to remove the catalyst. The solvent is removed in vacuo to give the free amino derivative of suitable purity to be taken directly on to the next step.

B. Acetic Acid Solvent

The Cbz-protected peptide derivative was dissolved in glacial acetic acid (20mL/mmol) and 10% palladium on carbon catalyst is added under a nitrogen atmosphere. The reaction vessel is flushed 5 times with nitrogen and 5 times with hydrogen and then maintained at 40 psig for about 2h. The hydrogen was then replaced with nitrogen and the reaction mixture filtered through a pad of celite to remove the catalyst. The filtrate was concentrated and the resulting product taken up in anhydrous ether and evaporated to dryness 3 times. The final product, the acetate salt, was dried in vacuo and is of suitable purity for subsequent conversion.

General Procedure for Removal of Boc-protecting Group  
with 4N Hydrochloric Acid in Dioxane

- The Boc-protected amino acid or peptide is treated with a solution of 4N HCl in dioxane with stirring at room temperature. Generally the deprotection reaction is complete within 15 minutes, the progress of the reaction is monitored by thin layer chromatography (TLC). Upon completion, the excess dioxane and HCl are removed by evaporation in vacuo. The last traces of dioxane and HCl are best removed by evaporation again from anhydrous ether or acetone. The hydrochloride salt thus obtained is thoroughly dried in vacuo and is suitable for further reaction.

EDC/HOBt Coupling of Cbz-Asparagine (General Procedure)

- N-CBZ-(L-asparagine (1.10eq) and N-hydroxybenzotriazole (HOBt) (1.5eq) are dissolved in dry dimethylformamide (DMF) (2-5mL/mmol) and cooled in an ice bath. 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC) (1.10eq) is added to the stirring solution and maintained at 0°C for 10 minutes. A solution of the amino component (free amine), 1.0eq in DMF (1-2mL/mmol), is added. [In the case of the amine hydrochloride or acetate salt, an equivalent of N-methylmorpholine is also added.] The reaction mixture is stirred at 0°C for 1 hour and then at room temperature for -5-6 hours. The reaction mixture is then poured into a rapidly stirring solution of 60% saturated aqueous sodium bicarbonate (ca-50mL/mmol). An immediate white precipitate forms which is collected on a Büchner funnel and the solid washed thoroughly with saturated aqueous sodium bicarbonate, water, 5% aqueous citric acid solution and water. The product is thoroughly dried in vacuo and redissolved in DMF, filtered and reprecipitated by the addition to water. The precipitated product is isolated by filtration, washed again with water and dried in vacuo.

General Procedure for Acylation with 2-Quinoline  
Carboxylic Acid N-Hydroxysuccinimide Ester

A solution of the free amine (or amine acetate salt) and 1.0 equivalent of N-hydroxysuccinimide 2-quinoline carboxylate in anhydrous dichloromethane was treated with 1.5 equivalents of N-methylmorpholine (NMM) at room temperature. The progress of the reaction was monitored by TLC and when the reaction was complete the reaction mixture was diluted with additional dichloromethane and the solution washed with saturated aqueous sodium bicarbonate, 5% aqueous citric acid, water and brine. The solution was dried over anhydrous magnesium sulfate, filtered and concentrated in vacuo. The product thus obtained was recrystallized from a mixture of acetone and hexane.

The Cbz group of the compounds shown in Examples 13 and 14 can be removed as described in Example 9 and the resulting compound can be coupled to a desired  $\alpha$ - or  $\beta$ -amino acid or the like to produce compounds of the present invention.

Example 15

The compounds shown in Table 7 were prepared according to the following general procedure. This general procedure represents a Curtius Rearrangement and reaction with the amino alcohol derivative as prepared following the general procedure in Example 9.

To a solution of 1 mmol of carboxylic acid in 12 mL of toluene and 3 mmol of triethylamine at 90°C under a nitrogen atmosphere, was added 1 mmol of diphenylphosphoryl azide. After 1 hour, a solution of 1

-89-

mmol of amino alcohol derivative in 3.5 mL of either N,N-dimethylformamide or toluene was added. After 1 hour, the solvent was removed under reduced pressure, ethyl acetate and water added and the layers separated.

5 The organic layer was washed with 5% citric acid, sodium bicarbonate, brine, dried, filtered and concentrated to afford the crude product. This was then recrystallized or chromatographed on silica gel to afford the purified final compound.

Example 16A. Preparation of 4(4-methoxybenzyl) itaconate

A 5 L three-necked round bottomed flask equipped with constant pressure addition funnel, reflux condenser, nitrogen inlet, and mechanical stirrer was charged with itaconic anhydride (660.8g, 5.88 mol) and toluene (2300 mL). The solution was warmed to reflux and treated with 4-methoxybenzyl alcohol (812.4g, 5.88 mol) dropwise over a 2.6h period. The solution was maintained at reflux for an additional 1.5h and then the contents were poured into three 2 L erlenmeyer flasks to crystallize. The solution was allowed to cool to room temperature whereupon the desired mono-ester crystallized. The product was isolated by filtration on a Buchner funnel and air dried to give 850.2g, 58% of material with mp 83-85°C, a second crop, 17% was isolated after cooling of the filtrate in an ice bath. <sup>1</sup>H NMR (CDCl<sub>3</sub>) 300 MHz 7.32(d, J=8.7 Hz, 2H), 6.91(d, J=8.7 Hz, 2H), 6.49(s, 1H), 5.85(s, 1H), 5.12(s, 2H), 3.83(s, 3H), 3.40(s, 2H).

B. Preparation of Methyl 4(4-methoxybenzyl) itaconate

A 5 L three-necked round bottomed flask equipped with reflux condenser, nitrogen inlet, constant pressure addition funnel and mechanical stirrer was charged with 4(4-methoxybenzyl) itaconate (453.4g, 1.81 mol) and treated with 1,5-diazabicyclo[4.3.0]non-5-ene (275.6g,

-92-

1.81 mol), (DBU), dropwise so that the temperature did not rise above 15°C. To this stirring mixture was added a solution of methyl iodide (256.9g, 1.81 mol) in 250 mL of toluene from the dropping funnel over a 45m period.

- 5 The solution was allowed to warm to room temperature and stirred for an additional 3.25h.

The precipitated DBU hydroiodide was removed by filtration, washed with toluene and the filtrate poured into a separatory funnel. The solution was

- 25 A 500 mL Fisher-Porter bottle was charged with methyl 4(4-methoxybenzyl) itaconate (71.1g, 0.269 mol), rhodium (R,R) DiPAMP catalyst (204mg, 0.269 mmol, 0.1 mol%) and  
30 degassed methanol (215 mL). The bottle was flushed 5 times with nitrogen and 5 times with hydrogen to a final pressure of 40 psig. The hydrogenation commenced immediately and after ca. 1h the uptake began to taper off, after 3h the hydrogen uptake ceased and the bottle  
40 was flushed with nitrogen, opened and the contents concentrated on a rotary evaporator to give a brown oil

10 D. Preparation of Methyl 2(R)-methylsuccinate

A 3 L three-necked round-bottomed flask equipped with a nitrogen inlet, mechanical stirrer, reflux condenser and constant pressure addition funnel was charged with methyl 4(4-methoxybenzyl) 2(R)-

15 methylsuccinate (432.6g, 1.65 mol) and toluene (1200 mL). The stirrer was started and the solution treated with trifluoroacetic acid (600 mL) from the dropping funnel over 0.25h. The solution turned a deep purple color and the internal temperature rose to 45°C. After

20 stirring for 2.25h the temperature was 27°C and the solution had acquired a pink color. The solution was concentrated on a rotary evaporator. The residue was diluted with water (2200 mL) and sat. aq.  $\text{NaHCO}_3$  (1000 mL). Additional  $\text{NaHCO}_3$  was added until the acid had

25 been neutralized. The aqueous phase was extracted with ethyl acetate (2 X 1000 mL) to remove the by-products and the aqueous layer was acidified to pH=1.8 with conc. HCl. This solution was extracted with ethyl acetate (4 X 1000 mL), washed with brine, dried over anhyd.  $\text{MgSO}_4$ ,

5 E. Preparation of Methyl Itaconate

15 A 50 mL round bottomed flask equipped with reflux condenser, nitrogen inlet and magnetic stir bar was charged with methyl 4(4-methoxybenzyl) itaconate (4.00g, 16 mmol). The solution was kept at room temperature for 18 hours and then the volatiles were

Preparation of Methyl N-Moz-α-methyl β-alanine.

A 5L four-necked round bottomed flask equipped with a nitrogen inlet, reflux condenser, mechanical stirrer, constant pressure addition funnel, and thermometer adapter was charged with methyl 2(R)-methylsuccinate (184.1g, 1.26 mol), triethylamine (165.6g, 218 mL, 1.64 mol, 1.3 equivalents), and toluene (1063 mL). The solution was warmed to 85°C and then treated dropwise with a solution of diphenylphosphoryl azide (346.8g, 1.26 mol) over a period of 1.2h. To a solution of 5.21g of 2(S)-methyl-3-mercaptopropionic acid t-butyl ester in 75 mL of toluene at 0°C was added 4.50g of 1,8-diazabicyclo[5.4.0]undec-7-ene and 1.94 mL of methyl iodide. After stirring at room temperature for 2.5 hours, the volatiles were removed, ethyl acetate added, washed with dilute hydrochloric acid, water, brine, dried and concentrated

The effectiveness of the compounds listed in Table 16 were determined in the above-described enzyme assay and in a CEM cell assay.

5           The HIV inhibition assay method of acutely infected cells is an automated tetrazolium based colorimetric assay essentially that reported by Pawles et al, J. Virol. Methods 20, 309-321 (1988). Assays were performed in 96-well tissue culture plates. CEM  
10 cells, a CD4<sup>+</sup> cell line, were grown in RPMI-1640 medium (Gibco) supplemented with a 10% fetal calf serum and were then treated with polybrene (2µg/ml). An 80 µl volume of medium containing  $1 \times 10^6$  cells was dispensed into each well of the tissue culture plate. To each  
15 well was added a 100µl volume of test compound dissolved in tissue culture medium (or medium without test compound as a control) to achieve the desired final concentration and the cells were incubated at 37°C for 1 hour. A frozen culture of HIV-1 was diluted in culture  
20 medium to a concentration of  $5 \times 10^6$  TCID<sub>50</sub> per ml (TCID<sub>50</sub> = the dose of virus that infects 50% of cells in tissue culture), and a 20µL volume of the virus sample (containing 1000 TCID<sub>50</sub> of virus) was added to wells containing test compound and to wells containing only  
25 medium (infected control cells). Several wells received culture medium without virus (uninfected control cells). Likewise, the intrinsic toxicity of the test compound was determined by adding medium without virus to several wells containing test compound. In summary, the tissue  
30 culture plates contained the following experiments:

-156-

	Cells	Drug	Virus
1.	+	-	-
2.	+	+	-
3.	+	-	+
4.	+	+	+

10 In experiments 2 and 4 the final concentrations of test compounds were 1, 10, 100 and 500  $\mu\text{g/ml}$ . Either azidothymidine (AZT) or dideoxyinosine (ddI) was included as a positive drug control. Test compounds were dissolved in DMSO and diluted into tissue  
15 culture medium so that the final DMSO concentration did not exceed 1.5% in any case. DMSO was added to all control wells at an appropriate concentration.

Following the addition of virus, cells were incubated at 37°C in a humidified, 5%  $\text{CO}_2$  atmosphere for  
20 7 days. Test compounds could be added on days 0, 2 and 5 if desired. On day 7, post-infection, the cells in each well were resuspended and a 100  $\mu\text{l}$  sample of each cell suspension was removed for assay. A 20  $\mu\text{L}$  volume of a 5 mg/ml solution of 3-(4,5-dimethylthiazol-2-yl)-2,5-  
25 diphenyltetrazolium bromide (MTT) was added to each 100  $\mu\text{L}$  cell suspension, and the cells were incubated for 4 hours at 27°C in a 5%  $\text{CO}_2$  environment. During this incubation, MTT is metabolically reduced by living cells resulting in the production in the cell of a colored  
30 formazan product. To each sample was added 100  $\mu\text{l}$  of 10% sodium dodecylsulfate in 0.01 N HCl to lyse the cells, and samples were incubated overnight. The absorbance at 590 nm was determined for each sample using a Molecular Devices microplate reader. Absorbance values for each  
35 set of wells is compared to assess viral control infection, uninfected control cell response as well as test compound by cytotoxicity and antiviral efficacy.
